Multidrug resistance in *P. aeruginosa* isolates is of growing concern in medical environments. There has been no change in the antibiotic patterns over the last 10 years. In summary, our findings show that the emergence of these resistant strains has gained popularity in clinical use. Our study will help in taking necessary steps to curb the alarming rise of resistance among *P. aeruginosa* isolates, which is the leading cause of infections in the hospital. **Source of Support:** Nil **Conflict of Interest:** None declared Radiation exposure in pediatric body CT: effect on DICOM study protocol. Our objective was to assess the impact of abdominal and pelvic computed tomography (CT) exposure on the DICOM (Digital Imaging and Communications in Medicine) study protocol created by the scanner manufacturer. A cohort of children undergoing routine body CT was prospectively studied. The protocol data were identified, and radiation exposure parameters were recorded. A total of 162 children were studied (71 abdominal, 91 pelvic), with a mean age of 2.8 years (range, 0.1 to 19.9 years). Mean dose length product for abdominal CT was
